RICHMOND HOUSE

RHIM BLENDED MODEL FACTSHEET

The RHIM Blended model aims to produce moderate levels of capital growth over the medium term with lower volatility than the IA sector average, investing in collective investment schemes. This is a multi-asset global portfolio with an equity weight between 45% and 65% which will include overseas equity exposure. The model will also typically use targeted return funds in order to reduce volatility associated with equity investing and at least 20% will be invested in fixed interest and/or property as deemed appropriate. Asset allocation will be actively managed whilst maintaining a balanced risk profile. Investors should be comfortable with periods of volatility, although this is expected to be lower than a pure equity portfolio. The model will sit within risk profile 5 on a scale of 1-10, where 1 is cash and 10 is 100% in high risk equity markets. Please see the reverse for historical volatility and peak to trough data.

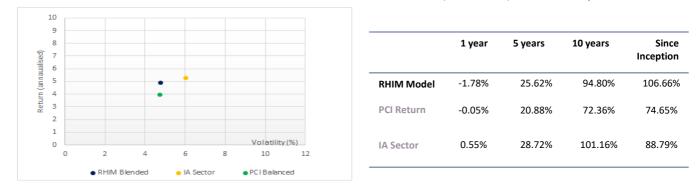

Commentary

May 2019 UPDATE

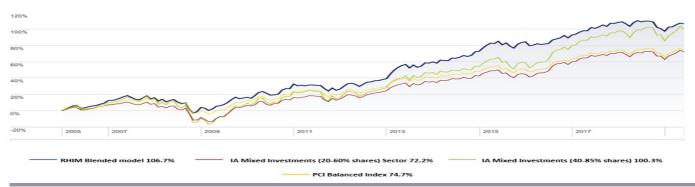

The Blended model was up 1.9% over the last three months as equity markets climbed in March and April before falling back in May when President Trump escalated the trade war with China. Corporate earnings have been weakening but share buybacks have been a big support to US equities. With the oil price falling on fears of a weaker economy, inflation expectations have come down and government bonds have done well. Over the year, the model was down 1.8% as almost all assets lost money in 2018. The Artemis US Select fund was up 10.6% as U.S. equities comfortably outperformed other equity markets. The Newton Global Income fund did even better, up 12.5%. The other equity funds in the model were down around 5% over the period. The equity long/short funds have held the model back over the last twelve months with the two funds down 4.3% and 10.6% as they are positioned for U.S. equities to fall. The Merian Gold & Silver fund was the worst-performing fund, down 15.7%, as equities rose and the US dollar strengthened. The fund has experienced big swings in performance but it has done well when U.S. equities have fallen while we expect gold to be a big beneficiary of the US-China trade war.

IA Sector	4.7%	8.2%	-27.7%

Risk

Higher-risk investments tend to experience greater volatility, which means they are likely to go up and down in value more often and by larger amounts than lower-risk investments. In return, higher-risk investments have the potential to produce higher returns over the long term, although this is not guaranteed. If you do not understand the risks involved with the portfolio it is important that you seek clarification from your Financial Adviser before making an investment.

This Factsheet

This factsheet demonstrates the exposure, characteristics and performance of the named RHIM model. Your actual portfolio may differ depending on your individual circumstances. All features described in this fact sheet are current at the time of publication and may be changed in the future.

Currency

Some funds will hold overseas assets and as a result will also have exposure to overseas currencies. Exchange rates can fluctuate and may cause the value of the investment to rise or fall.

Investment Term

It is generally accepted that equity investments should be regarded as long term investments and should be held for a minimum of five years, ideally longer. Your time horizon and capacity for loss are important considerations when selecting the most appropriate RHIM model.

Property Funds

The value of property is generally a matter of a valuer's opinion which may not be readily realisable. There are liquidity risks associated with investing in property whereby encashments may be delayed waiting for properties to be sold.

Performance

It should be noted that past performance is not necessarily a guide to future performance. The price of shares/units and income from them may fall as well as rise and is not guaranteed. RHIM Performance illustrated is net of fund charges, but does not include Richmond House Investment Management discretionary management fees, nor fees that may be incurred through your Financial Adviser. PCI returns are net of the Discretionary Manager charges and use provisional data.
