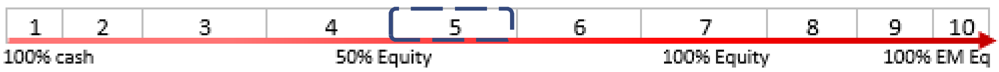
RHIM DYNAMIC MODEL FACTSHEET

The RHIM Dynamic model aims to produce an attractive level of capital growth over the medium term with lower volatility than the IA sector, investing in collective investment schemes. This is a multi-asset global portfolio with an equity weight of between 50% and 75% which will involve investing in UK and overseas equities, including emerging markets. However, the model will typically also use targeted absolute return funds in order to reduce volatility associated with equity investing and at least 15% will be also invested in fixed interest and/or property as deemed appropriate. Asset allocation will be actively managed around the higher side of medium risk profile. This means investors should be comfortable with periods of volatility, although this is expected to be lower than a pure equity portfolio. The model will sit within risk profile 5 on a scale of 1-10, where 1 is cash and 10 is 100% high risk equity markets. Please see the reverse for historical volatility and peak to trough data.

Risk Rating

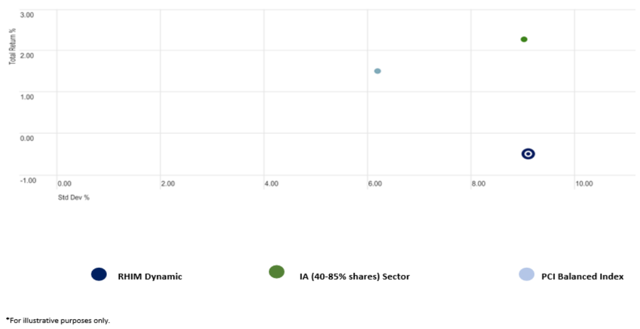


Commentary

April 2020 UPDATE

The Dynamic model rose 8.2% as equity markets rose on the back on the growing stream of stimulus packages from central banks and governments. Several of the model's holdings were up over 10% in the month, from the AXA Framlington Health fund, up 11%, to the UK smaller company funds, up 12% and 16%. The Aubrey and RWC emerging market equity funds were up 10% and 14% respectively. The best performing funds were the commodity funds, though, as the JPM Natural Resources fund rose 21% in April and the Merian Gold & Silver fund was up 29%. Commodity prices should rise on the back of governments' stimulus. The Covid-19 lockdowns caused demand to fall but they forced countries to print ever more amounts of money. Away from equities, the infrastructure and real asset funds were up 4-5% in April while the model's strategic bond fund rose 2%. The real asset funds will be more volatile than the perceived safety of government debt but they should be a better store of value going forwards.

Risk Return (5 years) as at 31st March 2020



Performance (Cumulative) as at 30th April 2020

	1 year	5 years	10 years	Since Inception

Risk
Higher-risk investments tend to experience greater volatility, which means they are likely to go up and down in value more often and by larger amounts than lower-risk investments. In return, higher-risk investments have the potential to produce higher returns over the long term, although this is not guaranteed. If you do not understand the risks involved with the portfolio it is important that you seek clarification from your Financial Adviser before making an investment.

This Factsheet
This factsheet demonstrates the exposure, characteristics and performance of the named RHIM model. Your actual portfolio may differ depending on your individual circumstances. All features described in this fact sheet are current at the time of publication and may be changed in the future.

Currency
Some funds will hold overseas assets and as a result will also have exposure to overseas currencies. Exchange rates can fluctuate and may cause the value of the investment to rise or fall.

Investment Term
It is generally accepted that equity investments should be regarded as long term investments and should be held for a minimum of five years, ideally longer. Your time horizon and capacity for loss are important considerations when selecting the most appropriate RHIM model.

Property Funds
The value of property is generally a matter of a valuer's opinion which may not be readily realisable. There are liquidity risks associated with investing in property whereby encashments may be delayed waiting for properties to be sold.

Performance
It should be noted that past performance is not necessarily a guide to future performance. The price of shares/units and income from them may fall as well as rise and is not guaranteed. RHIM Performance illustrated is net of fund charges, but does not include Richmond House Investment Management discretionary management fees, nor fees that may be incurred through your Financial Adviser. PCI returns are net of the Discretionary Manager charges and use provisional data.
