RHIM INCOME MODEL FACTSHEET

The RHIM Income model aims to produce a yield in the region of the FTSE All Share and modestly grow the capital over the medium term. The model is likely to experience similar volatility to the IA sector given that it stays invested within income producing assets throughout the cycle. This is a multi-asset global income portfolio with an equity weight between 40% and 55% which will include overseas equity exposure, balanced with at least 35% in fixed interest and property as deemed appropriate. Asset allocation will be actively managed whilst maintaining a balanced risk profile. Income generated can be withdrawn or reinvested. Investors should be comfortable with periods of volatility, although this is expected to be less than a pure equity portfolio. Withdrawing income will reduce growth potential. The model will sit in profile 5 on a scale of 1-10, where 1 is cash and 10 is 100% high risk equity markets. Please see the reverse for historical volatility and peak to trough data.

Commentary

April 2020 UPDATE

The Income model rose 5.8% recovering some of the losses from March when equity markets plummeted. Equity markets rose on the back of a range of stimulus measures from central banks and governments. However, the best-performing sectors were the growth sectors like technology which tend not to pay dividends. The equity funds performed well, though, and a couple were up more than 10% in April. These are tilted to assets that go up in value the more money governments print. The M&G Global Dividend fund was up 14% and the M&G Global Listed infrastructure fund was up 12%. The real asset funds were up 4-5% while the model's strategic bond fund was only up 2%. Gold has no yield so the gold equity fund is a small weight in the Income model but it was up 29% in April recovering its losses from March. We have diversified the model into assets that rise in value when governments print money. This is likely to increase the model's volatility but we believe these assets will be a better store of value going forwards.

Risk Return (5 years) as at 31st March 2020

<i>Arc Balanced Asset PCI</i>	3.29%	6.39%	-16.60%

Risk

Higher-risk investments tend to experience greater volatility, which means they are likely to go up and down in value more often and by larger amounts than lower-risk investments. In return, higher-risk investments have the potential to produce higher returns over the long term, although this is not guaranteed. If you do not understand the risks involved with the portfolio it is important that you seek clarification from your Financial Adviser before making an investment.

This Factsheet

This factsheet demonstrates the exposure, characteristics and performance of the named RHIM model. Your actual portfolio may differ depending on your individual circumstances. All features described in this fact sheet are current at the time of publication and may be changed in the future.

Currency

Some funds will hold overseas assets and as a result will also have exposure to overseas currencies. Exchange rates can fluctuate and may cause the value of the investment to rise or fall.

Investment Term

It is generally accepted that equity investments should be regarded as long term investments and should be held for a minimum of five years, ideally longer. Your time horizon and capacity for loss are important considerations when selecting the most appropriate RHIM model.

Property Funds

The value of property is generally a matter of a valuer's opinion which may not be readily realisable. There are liquidity risks associated with investing in property whereby encashments may be delayed waiting for properties to be sold.

Performance

It should be noted that past performance is not necessarily a guide to future performance. The price of shares/units and income from them may fall as well as rise and is not guaranteed. RHIM Performance illustrated is net of fund charges, but does not include Richmond House Investment Management discretionary management fees, nor fees that may be incurred through your Financial Adviser. PCI returns are net of the Discretionary Manager charges and use provisional data.
